

Prepared the following dockerfile for the hello-world:-

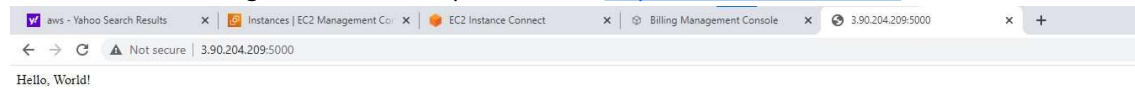

```
FROM python:3.9-slim-buster
WORKDIR /app
COPY requirements.txt .
RUN pip install --no-cache-dir -r requirements.txt
COPY . .
EXPOSE 5000
CMD ["python", "app.py"]
```

created the docker container using the same dockerfile

`docker build -t hello-world .`

`docker run --name hello-world -d -p 5000:5000 hello-world`

At the time of running the instance the public IP was <http://3.90.204.209:5000/>

---

However while you will be testing kindly ping me on my whatsapp, so that I will restart the instance, and then you can cross-check. As I am not leaving the instance running , so as to save the cost.
